

WHAT IS THE NUTRIENT?

Nitrogen- Used for vegetative growth of leaves, stems, etc. Forms chlorophyll, and helps build cell walls.

Potash-Strengthen plant roots and stems. Helps in ensuring plants use water efficently.

Calcium- Needed for cell formation and development.

Nitrogen-Used for vegetative growth of leaves, stems, etc. Forms chlorophyll, and helps build cell walls.

Potash-Strengthen plant roots and stems. Helps in ensuring plants use water efficently.

Magnesium- Helps to form chlorophyll. Helps create oxygen through photosynthesis.

Molybdenum- Regulate all the other nutrients,

Nitrogen-Used for vegetative growth of leaves, stems, etc. Forms chlorophyll, and helps build cell walls.

Magnesium- Helps to form chlorophyll. Helps create oxygen through photosynthesis.

Calcium-Needed for cell formation and development.

Iron- Associated with energy. Helps form chlorophyll.

Phosphoric Acid- Is crucial to the development of flowers, fruit, seeds, and strong roots.

Potash- Strengthen plant roots and stems. Helps in ensuring plants use water efficently.
